# Game

A game is a search problem with the following components:

- ▶  $S_0$  : The initial state, which specifies how the game is set up at the start.
- ▶  $\text{PLAYER}(s)$ : Defines which player has the move in a state.
- ▶  $\text{ACTIONS}(s)$ : Returns the set of legal moves in a state.
- ▶  $\text{RESULT}(s, a)$ : The transition model, which defines the result of a move.
- ▶  $\text{TERMINAL-TEST}(s)$ : A terminal test, which is true when the game is over and false otherwise. States where the game has ended are called terminal states.
- ▶  $\text{UTILITY}(s, p)$ : A utility function (also called an objective function or payoff function), defines the final numeric value for a game that ends in terminal state  $s$  for a player  $p$ . In chess, the outcome is a win, loss, or draw, with values  $+1$ ,  $0$ , or  $1/2$ . A zero-sum game is defined as one where the total payoff to all players is the same for every instance of the game.

# Game tree

# Minimax algorithm

```
function MINIMAX-DECISION(state) returns an action  
  return arg  $\max_{a \in \text{ACTIONS}(s)}$  MIN-VALUE(RESULT(state,a))
```

---

```
function MAX-VALUE(state) returns a utility value  
  if TERMINAL-TEST(state) then return UTILITY(state)  
   $v \leftarrow -\infty$   
  for each a in ACTIONS (state) do  
     $v \leftarrow \text{MAX}(v, \text{MIN-VALUE}(\text{RESULT}(s,a)))$   
  return v
```

---

```
function MIN-VALUE(state) returns a utility value  
  if TERMINAL-TEST(state) then return UTILITY(state)  
   $v \leftarrow \infty$   
  for each a in ACTIONS (state) do  
     $v \leftarrow \text{MIN}(v, \text{MAX-VALUE}(\text{RESULT}(s,a)))$   
  return v
```
